DETAILED ACTION

Claim Objections

Claims 14-15 are objected to because of the following informalities:

The dependency of the claims 14-15 are improper.

Appropriate correction is required.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 24-26 are rejected under 35 U.S.C. 102(b) as being anticipated by Francke et al. (US 2004/0141588) (see US 6873682B2 for reference).

Regarding claims 24-26, Francke teaches a method, apparatus or program medium for controlling exposure time having:

an arrangement configured to count a number of photons detected by a displaceable detector which comprise an end portion arranged as a leading edge in a scanning direction,

a comparator arrangement configured to compare the counted number of photons from a sensor in the end portion under a scanning movement with a preset value and

a controller arrangement configured to control the speed of the detector displacement with respect to a result obtained from a signal from the sensor, said signal corresponding to a density of an object to be examined under the scanning movement (paragraphs 13-14 and 57-58).

Response to Arguments

Applicant's arguments filed 4/11/2008 have been fully considered but they are not persuasive.

Francke teaches a detector units are distributed in an array such that one dimensional image of the radiation from a plurality of one dimensional detector units are distributed over a substantial portion of the two dimensional image of the subject (paragraph 13). By means of detecting radiation by the array of one dimensional detector during a short period of time during an initial part of a scan a picture of line images distributed over a substantial portion of the picture is obtained very fast (paragraph 14). An optimum exposure time for each readout during the subsequent scan or the remainder of the scan is then calculated based on information deduced from the picture (initial scan) of line images and on the short period of time. The optimum exposure time for the scanning based detection can be calculated based on an integrated signal value of one or some of the one-dimensional detector units (paragraph 57). The speed at which the array of one-dimensional detector units is moved relative the breast during scanning adjusted depending on the detector of x-rays during an initial part of the scan (paragraph 58). Accordingly, Francke teaches the claimed limitations in claims 24-26 and the claims are remain rejected.

Allowable Subject Matter

Claims 1-23 are allowed over prior art.

Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.
